

AI-Powered Social Media Agent

Problem Statement

Brands, influencers, and organizations struggle to keep up with the fast-paced and fragmented world of social media. Content trends evolve hourly, audience sentiment shifts rapidly, and competitor strategies are difficult to track. Managing multiple platforms often leads to scattered insights, missed engagement opportunities, and ineffective campaigns. The challenge is to collect, analyze, predict, and recommend actions in real time.

Objectives

1. Fuse multichannel data from X, Instagram, LinkedIn, and Facebook.
2. Enable multimodal interaction using text, image, and voice.
3. Forecast trends, sentiment, competitor engagement, and best posting times.
4. Visualize real-time analytics through an interactive dashboard.

Proposed Solution

Develop an Agentic AI application using IBM Orchestrate, IBM Langflow, and IBM Granite Models. Multiple AI agents collaborate to detect trends, generate content, analyze sentiment, monitor competitors, and recommend optimal posting strategies. A unified dashboard provides predictive analytics and actionable insights.
